

1) The proper way to get access to the managed object context is to inject it into each view controller as they are built and accessed

As i could see `let appDelegate = UIApplication.sharedApplication().delegate as! AppDelegate` at a lot of places

Please don't misuse the App Delegate

2) EHCoreDataStack should not be a singleton

As said Since we always talk to the same store and model they can be put into singleton but not hard and fast rule as such , but not good practice to put managed contexts in singleton, i would suggest remove the singleton thing
