

## Code review comments

- 1) When we add technology we are saving empty value into core data and fetching the same into source list, its not required . We need to only save once when user enters the technology name in the technology field (Padalingam)
- 2) Rewrite the error handling module using enum (Padalingam)
- 3) In EHTechnologyViewController module

```
for views in self.view.subviews
{
    views.hidden = true

    //views.removeFromSuperview()
}
```

Why cant we set the feedback controller as the content view controller for window controller instead for using above code ? (Vipin)

- 4) In EHCandidateController module

```
func control(control: NSControl, textShouldEndEditing fieldEditor: NSText) -> Bool ( Pratibha )
```

- switch statement inside this method does not really use the power of switch in as in swift please rewrite the switch statement in the module
- even though the data is invalid EHCoreDataHelper.saveToCoreData(candidate) is getting called and data is getting saved to the sql file store it should not happen
- above method should get called and saved to sql file store only if all data entered are valid

- 5) Stick to coding conventions and coding guidelines as per defined by Apple

<https://swift.org/documentation/api-design-guidelines/>
